a A diagnosis becomes an executable contract

ILLUSTRATIVE EPISODE

Trace observation
A dependent action follows a receipt that did not verify its prerequisite.

→

Failure attribution
The program never preserved the prerequisite as a usable runtime fact.

→

Repair hypothesis
Record the fact and reuse it in both context and the action check.

b Paired replay localizes the behavioral change

Execution point	Parent	Candidate	Evidence to retain
1 **Tool receipt**	Receipt arrives	Observer records status	Receipt + state write
2 **Next context**	Uses raw history	Shows missing prerequisite	Context contribution
3 **Proposed action**	Dependent call proceeds	Check redirects to verify	Intervention event
4 **Continuation**	No enforced recovery	Retry after verification	Next observed action

c Judge the mechanism on all matched tasks

Target failures may recover. Existing successes can regress if the check fires too broadly.

Compare activation, repairs, and regressions before retaining the complete candidate.
